Ultrascale Systems Research Center (USRC)

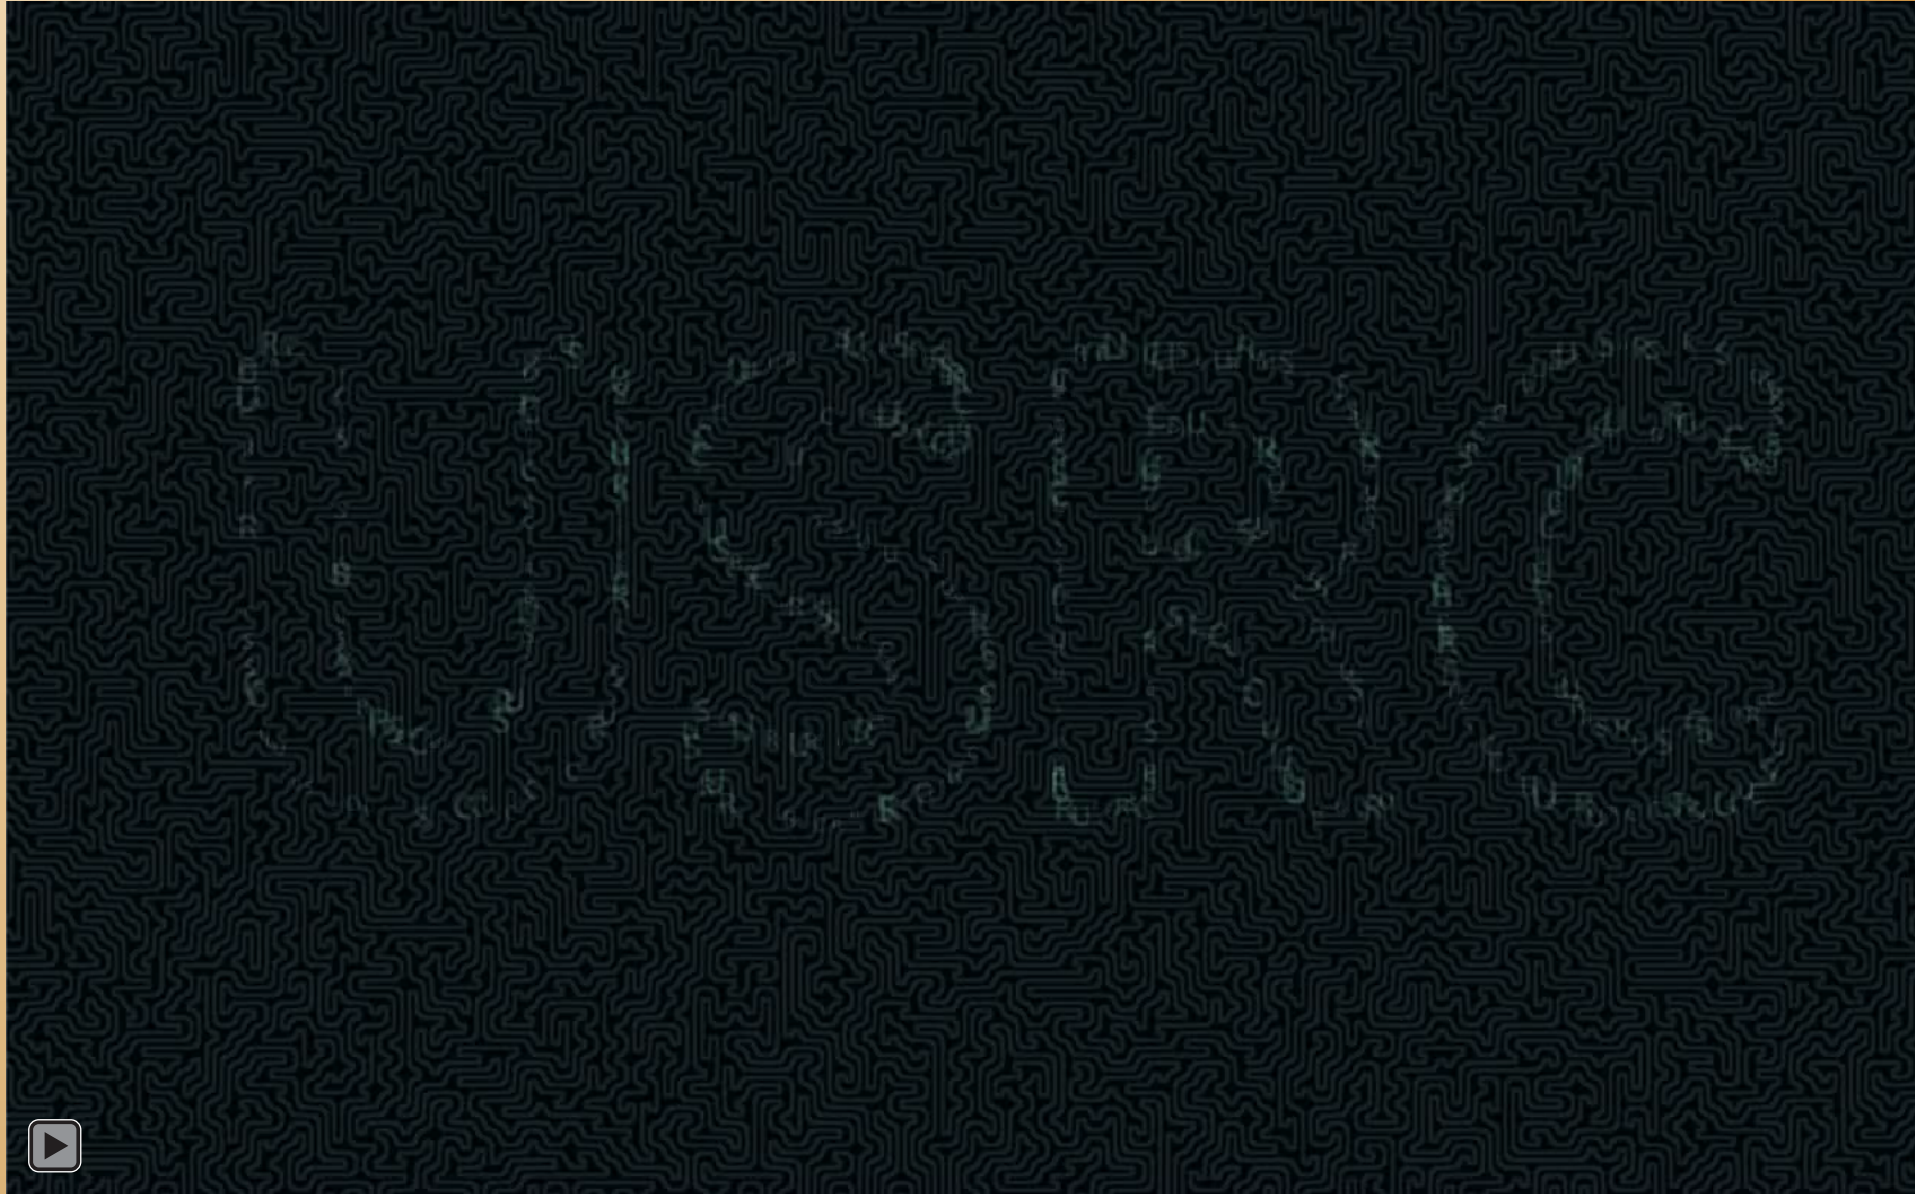

The Ultrasclae Systems Research Center is a colaboration between the New Mexico Consortium and LANL to engage universities and industry nationally in support of exascale research.

In order to make Exascale computing a reality, in depth collaboration with top universities, top industry partners, and national research labs will be necessary.

These interactions will be in-person, where collaborators come to the USRC for months, up to years, for intense cooperative research. USRC is interested in combination of University professors, students (UGS, GRA, PostDoc), and industry visitors.

We are currently looking for graduate students who have completed course work and are interested in HPC exascale dissertation and thesis topics.
